> 25 Sep 2018 11:21:00 +02007 Effective ways to Securise your Computer The key to securing your computer is encryption. Once your password and credentials are known, it is very easy for hackers to compromise your system and steal your data. Although cloud services are nice when you need a resource, be cautious of giving away your password for security purposes. This applies to your computer as well. Many services will automatically send data to Cloud services (e.g. pictures from a camera) and passwords are easy to remember when they are not encrypted. The best way to secure your computer is to encrypt everything you want to keep secure. Then, take that decrypted information off-site, which makes things easy to manage. For instance, I use Cloud Backup software to back up and encrypt files. > The key to securing your computer is encryption. Introduction Who doesn't remember clicking on a 'shortcut' on a desktop or start menu of Windows and getting access to a tool like MSN Explorer, or the one for Internet Explorer? These mini-apps can be incorporated into the start menu of your computer, offering a quick way to connect to your favorite services or tools. We all know the actions you perform, such as checking email, looking for friends on Facebook, playing games, listening to music, ... The name didn't change, but the way the shortcuts behave have certainly evolved. In fact, we are dealing with a kind of mini-apps, which are called stand-alone. What's more, a lot of users are looking for a way to hide the 'mini-app' inside their system. Needless to say, such a functional is a must-have application for today's users. If you're addicted to your social networking sites, or want to know some information about your wireless routers, or simply would like to copy some data from one PC to another, copying files to USB sticks is not enough. What you really need is a portable app to do this job in one click, to avoid extra work on your PC. It is not an exotic concept; the stand-alone shortcuts originated in the 90s with various designs, and nowadays are often used by users. So, what would this kind of app be missing if it doesn't include a mini-app to use on PCs? We all know the actions you perform, such as checking email, looking for friends on Facebook, playing games, listening to music, ... All this sounds good, but how do you implement it? It seems that the task is quite complicated, so it is not surprising that users experience difficulties with apps like this. We have seen some drawbacks: the stand-alone apps lack a desktop icon that would immediately address the situation of a computer administrator. He would need to execute a command-line command to launch the app, and right then and there the operation is initiated. Another objection is the lack of integrating the actions with the GUI-based functionality of Windows. You cannot include the functionality that you need to introduce in a stand-alone application. The major advantage that stand-alone applications have over their counterparts is that they can perform all the tasks you need to do on the PC via a single utility. Here is where SNMPGetSet comes in. The tool
