Q: What is the precedence of unit tests in functions? What would be the preference of writing a unit test for a function that returns a function for the following situations: A function that returns a function which returns another function. A function that returns a function which returns itself. A function that returns another function which returns itself. Having full unit tests applied to the functions is not a concern here. A: I like to follow this general rule in my tests: A test for code outside of the class should be a test, not a unit test. A test for code inside the class should be a unit test, not a test. Applying this to the case at hand, the class under test is the outermost function. So the test should be a test of the class, not a unit test. On the other hand, the innermost functions are the first and second-to-last use cases of an algorithm with associated unit tests, so they should be unit tests. It's all a matter of convention.

Q: How to get a unique entity when using optimistic concurrency in the database? I'm using Entity Framework 5 and the latest version of the database provider. I created a simple entity called 'Task' and an entity that contains that entity.

```
public class Task { public int Id { get; set; } public string Name { get; set; } public DateTime StartedAt { get; set; } public bool IsComplete { get; set; } public DateTime? EndDate { get; set; } [ForeignKey("MarkerId")] public virtual Marker Marker { get; set; } } public class Marker { public int Id { get; set; } public string Name { get; set; } public DateTime CreatedAt { get; set; } [ForeignKey("CreateUserId")] public virtual CreateUser CreateUser { get; set; } } public class CreateUser { public int Id { get; set; } public string Username { get; set; } public DateTime
```
